

How To Install Lightroom Mobile Presets On Your Smartphone.

Before you get started, please download the preset on your phone. It should be stored on your downloads folder. So let's get started!

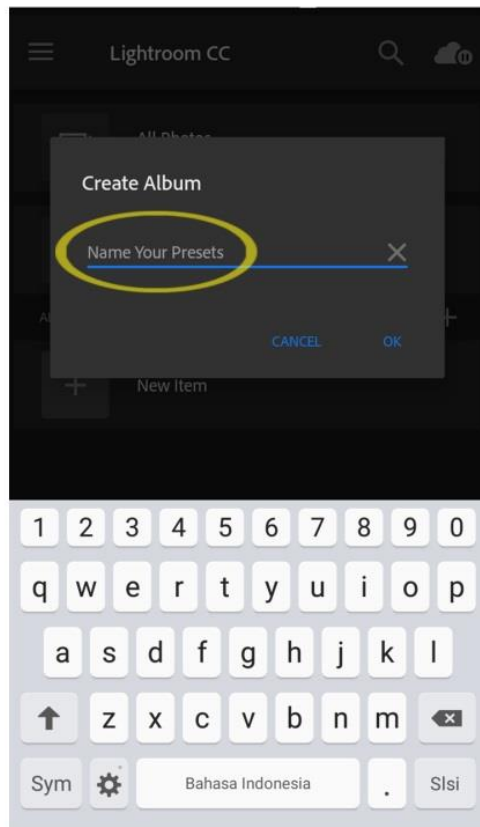

Step 1

In the menu of Mobile Lightroom, click the + to add a new album.

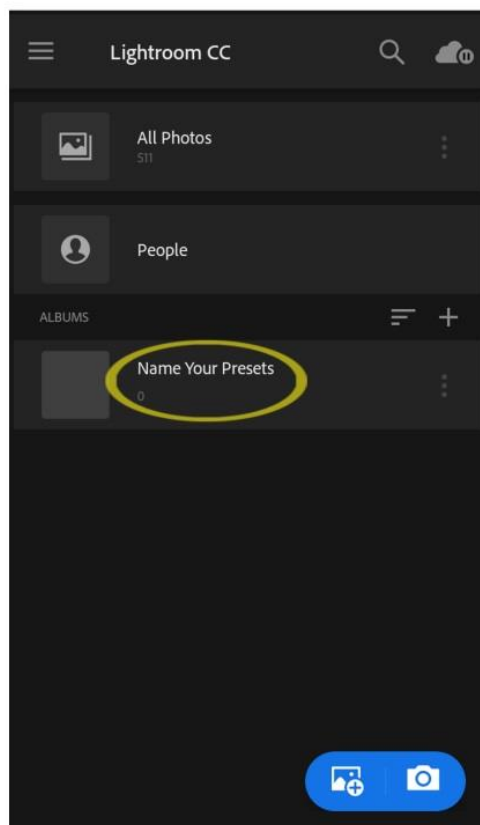

Step 2

Tap on album

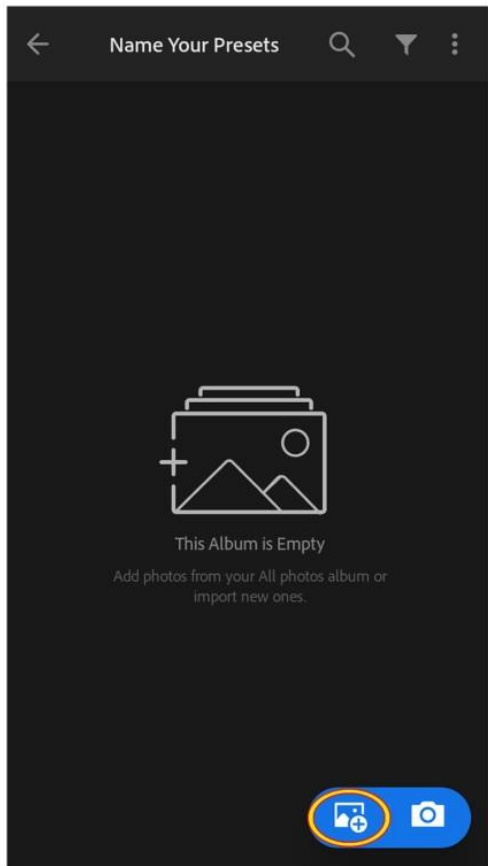

Step 3

Name your album. You can name it the same as the preset if you want.

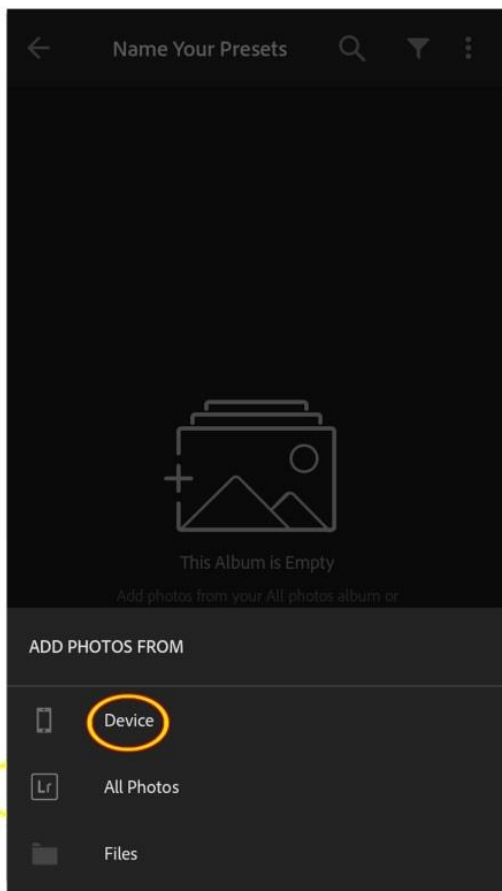

Step 4

Once you named your preset, click on the album you just created.

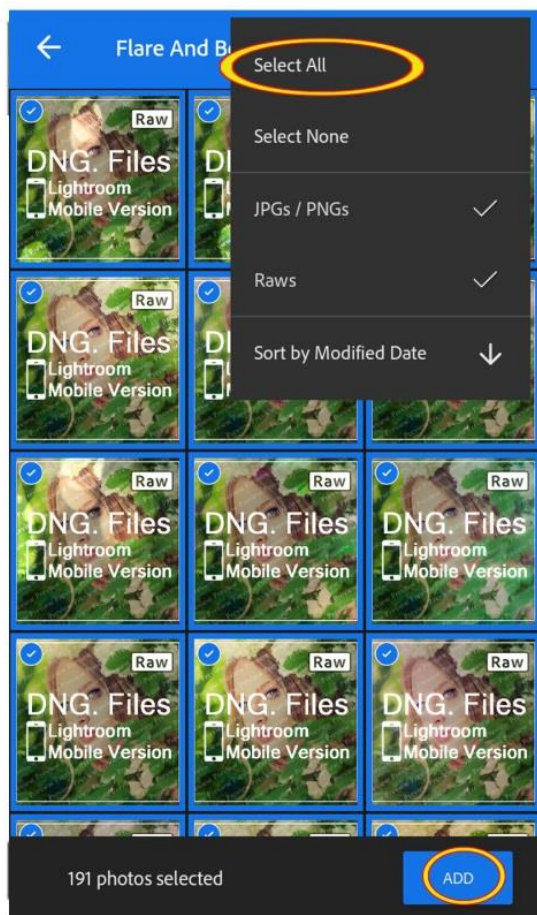

Step 5

Once your in the album, tap on the upload new photo button. It's the one with the “+” next to the photo icon.

Step 6

This box should pop up asking where your photo is located. Click on the device since that's where the preset that you download should be located.

Step 7

Once you click on device your recent downloads should appear. This is where you select the preset you download on your phone.

Note: This will look different if you're using an iPhone, make sure the file is DNG.

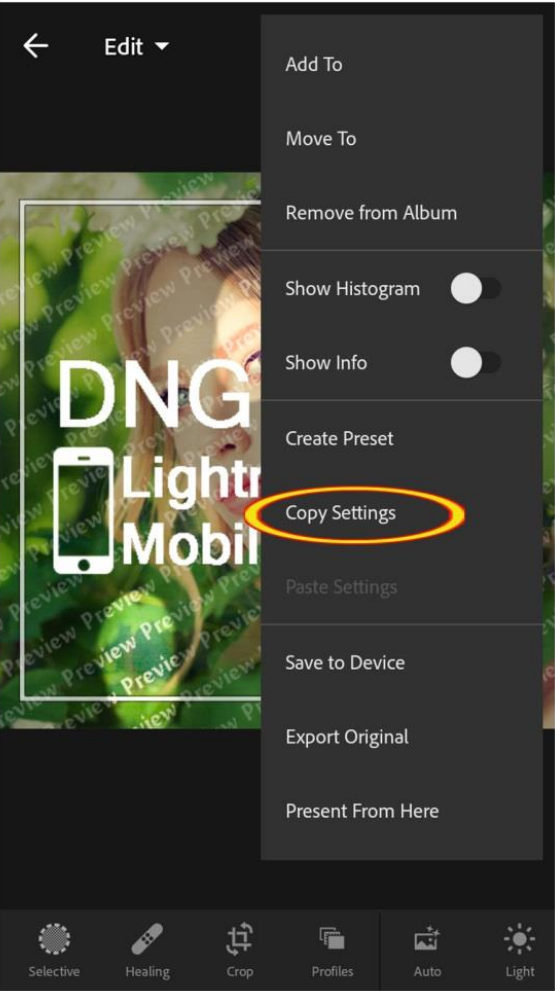

Step 8

This is the process where you place a preset to any photo you want. In this example,

Tap on the 3 dots on the top right corner.

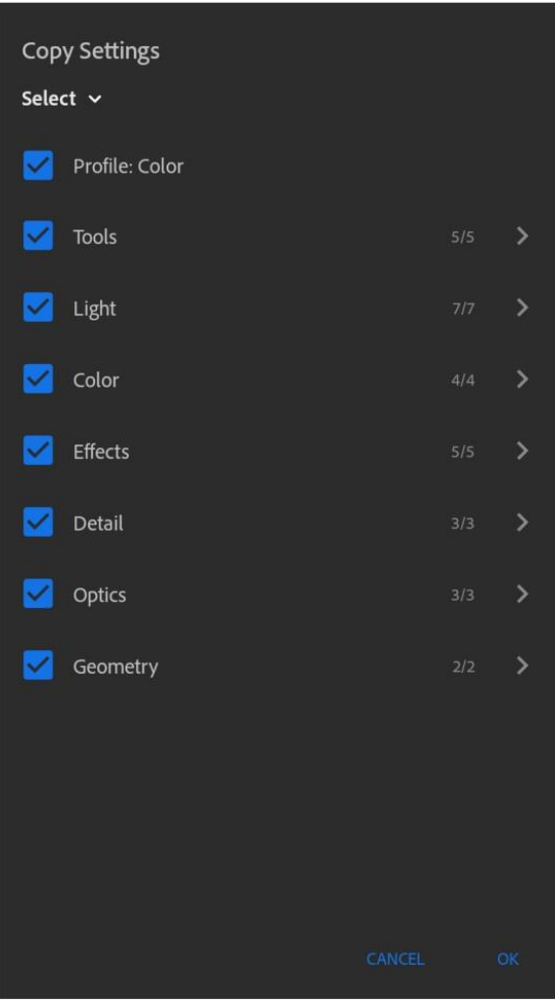

Note: All my presets will be named with a photo cover. Just like the one you see here. This is how you will know which is a preset.

Step 9

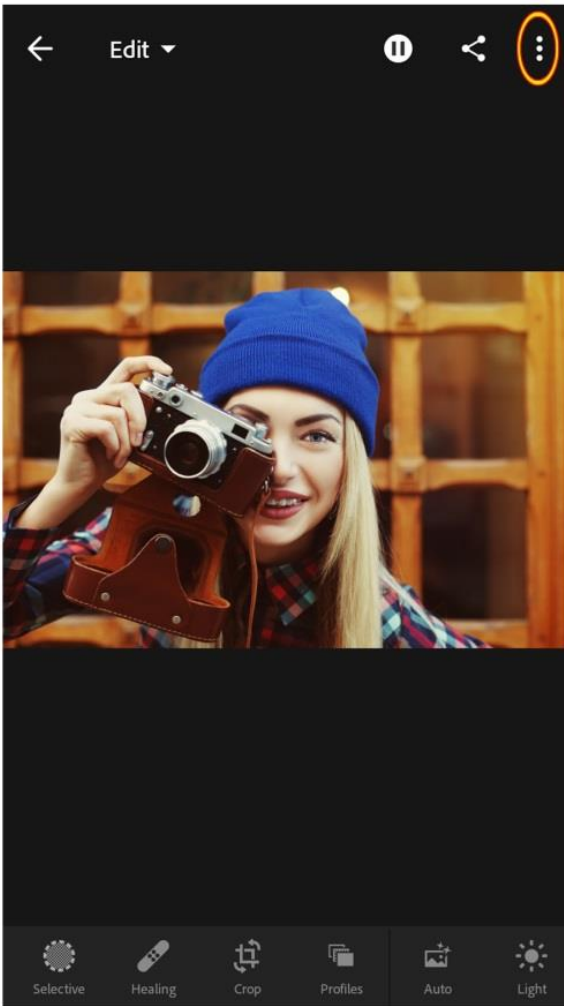

Then click on the “copy settings.”

The reason why you’re doing this is because all the preset settings are saved on this photo cover. So basically you’re copying the preset settings that are placed on this cover and pasting it on your own photo.

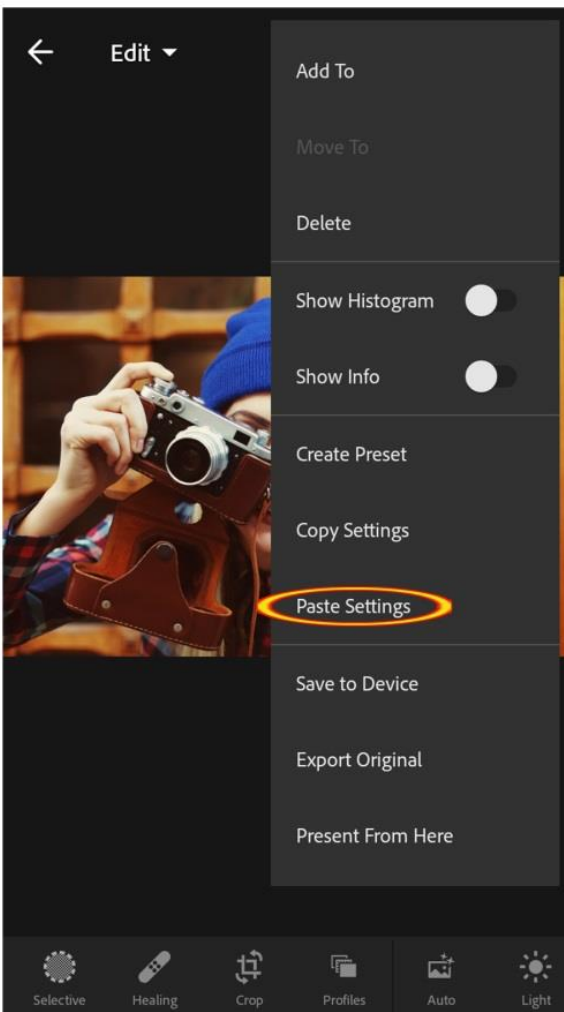

Step 10

This settings box will pop up. Make sure “Select All” is on, then tap ok.

Step 11

Now, go back to app menu and select the photo you want. I'm using this photo in this example. Click on the 3 dots again.

Step 12

Tap on “Paste Settings” and you’re done!
After the preset is placed, you can adjust other settings to your liking.

Note: You can do this to any photo once you copy the preset. You don’t have to go back and copy the preset again, unless you want a different preset.
