01. Open the Lightroom Classic app on your desktop.

02. Select "Develop Module".

03. Select "File" from the menu bar, select "Import Develop Profiles and Presets" and then select the preset .ZIP file.

MODERN PRESETS FOR LIGHTROOM

I'm a professional photographer and I edit my photos with the presets I create to give an unique mood to my images for my personal website, blog and Instagram.

My presets are really adaptable and that I've tried them on different photos, but please always bear in mind that all of them may look different on every photo just because **every photo is different** because of its exposure, white balance, colors, locations etc. So maybe you'll have to edit them a little bit after the preset is applied.

These presets are for personal and professional use only, not for further distribution, so you're not allowed to share them or sell them (as is or with adjustments).
