

## How to Import New LUTs in Filmora?

To import new LUTs into Filmora you just have to add the Custom LUT to the timeline from the video editor's LUT library, and double-click on it. Extend the 3D LUT drop-down menu and choose the Load New LUT option.

Navigate to the location on your hard drive at which the LUT you want to import is saved, click on it to select it and then click on the Open button to load the LUT. Click on the OK button in the lower-right corner of the tab to complete the process.

## Important Guidelines Before Using LUTs

- Ensure white balance is correct when using LUTs! This will dramatically change the look of the LUT.
- Ensure your exposure is correct when using LUTs and your image is not too bright or too dark
- When using LUTs, your footage may need small adjustments to get optimal results, such as exposure, saturation, contrast, etc. depending on your preference.
- Shooting conditions such as lighting, weather, locations etc. can vary which can drastically affect a LUTs look. Some LUTs will work better in different scenarios. It's best practice to experiment with which LUTs work best for your style and scenes.
